A Report Description

The Membrane Electrode Assembly (MEA) is the core component of a fuel cell that helps produce the electrochemical reaction needed to separate electrons. On the anode side of the MEA, a fuel (hydrogen, methanol etc.) diffuses through the membrane and is met on the cathode end by an oxidant (oxygen or air) which bonds with the fuel and receives the electrons that were separated from the fuel. Catalysts on each side enable reactions and the membrane allows protons to pass through while keeping the gases separate. In this way cell potential is maintained and current is drawn from the cell producing electricity.

In the future, with the development of technology and improvement of economic level, and the stable demand in fuel cell industry, the Membrane Electrode Assemblies will have great increase range; the developing countries will be high growth rate market.

According to this study, over the next five years the Membrane Electrode Assemblies (MEA) market will register a 18.4% CAGR in terms of revenue, the global market size will reach US\$ 680 million by 2024, from US\$ 290 million in 2019.
