### A Report Description

Mixed or merged reality is defined as the blending of the physical and digital worlds. In layman's terms, it's what happens when virtual and augmented reality have a baby. Ideally, you'd put on a headset that could map your position as well as everything in the room and from that, overlay a hologram onto the physical world that would acknowledge the real-world boundaries of a coffee table or couch. A true MR headset would support both this kind of augmented reality and the closed world of virtual reality.

#### Scope of the Report:

Unlike Oculus and Vive, WMR headsets use a pair of front-mounted cameras and a set of built-in sensors to map your physical position. Called inside-out tracking, the design allows for six-degrees-of-freedom (6DoF) movement tracking without the need to buy external sensors and set them up in a dedicated space. They're made to be plug-and-play for the most part, too, so you can be up and running in minutes just about anywhere.

The worldwide market for Mixed Reality Headsets is expected to grow at a CAGR of roughly xx% over the next five years, will reach 2000 million US\$ in 2023, from 2000 million US\$ in 2017, according to a new GIR (Global Info Research) study.
